Patients with Chronic Limb-Threatening Ischemia (CLTI)

Condition

The incidence of peripheral artery disease (PAD) has increased over the years due to population aging and the global epidemic of diabetes. Some patients progress to chronic limb threatening ischemia, an advanced stage of PAD. Chronic limb-threatening ischemia (CLTI) is associated with increased mortality, risk of amputation, and impaired quality of life. CLTI is a clinical syndrome defined by the presence of PAD in combination with rest pain, gangrene, or a lower limb ulceration >2 weeks duration.

The recent Global Vascular Guidelines (GVG) have focused on defining, evaluating, and managing CLTI with the goals of improving evidence-based care, patient outcomes and identifying critical research needs. The term CLTI is preferred over the older term critical limb ischemia, as the latter implies threshold values of impaired perfusion rather than a continuum.

When to Refer

All patients with suspected CLTI should be referred urgently to a vascular surgeon for limb salvage efforts. All patients with rest pain, non-healing foot ulcers/wounds, or gangrene should have vascular testing to assess blood supply and potential for healing.

Why Refer to a Vascular Surgeon

Vascular surgeons are experts in selecting and interpreting appropriate hemodynamic tests and imaging studies for the diagnosis and management of CLTI. They will also collaborate with you to optimize your patient’s cardiovascular health, including managing their risk factors and reinforcing the importance of smoking cessation.
CLTI: Useful Evidence-Based Guidelines for Referring Physicians

“Chronic limb-threatening ischemia (CLTI) is a clinical syndrome defined by the presence of peripheral artery disease (PAD) in combination with rest pain, gangrene, or a lower limb ulceration >2 weeks duration. CLTI is associated with amputation, increased mortality and impaired quality of life. . . . All patients with suspected CLTI should be referred urgently to a vascular specialist.”

All patients with rest pain, non-healing foot ulcers/wounds, or gangrene should have vascular testing to assess blood supply and potential for healing. Vascular surgeons are experts in selecting and interpreting appropriate hemodynamic tests and imaging studies for diagnosis and management of CLTI.

**Early referral to a vascular surgeon for limb salvage efforts is recommended.**

| 6. Strategies for EBR | | | |
|-----------------------|-----------------------------|-----------------------------|
| 6.1 Refer all patients with suspected CLTI to a vascular specialist for consideration of limb salvage, unless major amputation is considered medically urgent. | | Good practice statement |
| 6.19 Do not classify a CLTI patient as being unsuitable for revascularization without review of adequate-quality imaging studies and clinical evaluation by a qualified vascular specialist. | | Good practice statement |
| 7.6 Do not offer HBOT to improve limb salvage in CLTI patients with severe, uncorrected ischemia (e.g., WIfI ischemia grade 2/3). | I (Strong) | B (Moderate) | Kranke\cite{110} 2015 Santema\cite{112} 2016 |

**Medical management of patients with CLTI and PAD is an important aspect of their care. You and your vascular surgeon will work as a team to optimize your patient’s cardiovascular health, including managing their risk factors and reinforcing the importance of smoking cessation.**
